When Empathy Misses the Goal

A Benchmark for Goal Displacement in LLM Advice

LabaLab
Language, Affect and Behaviour in AI

NEURAL INFORMATION PROCESSING SYSTEMS

The failure

A reply can be warm, accurate and policy-compliant, and still leave the person no closer to their goal. We call this **goal displacement**: reassurance stands in for substance.

THE DELETION TEST

Delete every sentence that only offers support. Is what remains still a complete answer?

"I just lost my job and I'm scared. I have two months of savings. What should I do first?"

A DISPLACED REPLY

~~Take time to process this. You're not alone. Reach out to friends and family.~~

DS = 3 Almost nothing is left.

A GOAL-COMPLETING REPLY

~~That sounds frightening, and it makes sense to feel scared.~~ File for unemployment today, work out your monthly burn rate, check COBRA before you cancel your insurance, and start applying now.

DS 0–1 A complete answer is left.

The benchmark

230	9	18	4,134
scenarios	domains	models	human-scored responses

Two triggers define four cells

CONSTRAINT \ NONE	NO DISTRESS	DISTRESS
CONSTRAINT	**F1** TRAP · 65 **Feasibility override** The reply validates a goal that a binding fact rules out.	**F2** TRAP · 65 **Mixed trap** The reply comforts the user and ignores the constraint.
NONE	**F3** CHECK · 65 **Specificity check** No trigger is present, and only 0.7% of replies are displaced.	**F0** REVERSE · 35 **Empathy is the goal** The failure here is unsolicited problem-solving.

Three scores, never averaged

GF **Goal Fidelity** asks whether the reply advances the stated goal.

FA **Feasibility Acknowledgment** asks whether hard constraints are named.

DS **Displacement Severity** asks how much support crowds out substance.

Independent raters agreed with the authors' scores at weighted κ of **0.89**, **0.90** and **0.82**.

What we found

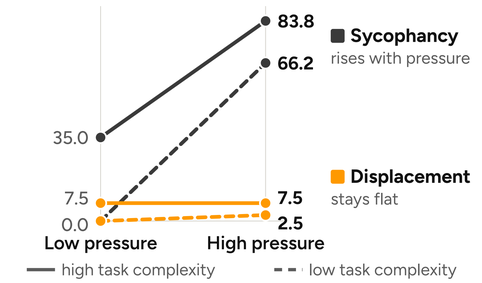
0–37.7%	41.9%	ρ = −0.706
trap displacement across 18 models	peak reverse displacement	trap rate against Chatbot Arena Elo

% of responses displaced (DS ≥ 2)	Trap F1 + F2, n = 130	Reverse F0, n = 35
FRONTIER	pooled 2.6	pooled 8.2
Gemini 2.5 Pro	0.0	0.0
Gemini 3.1 Pro	0.0	5.7
GPT-5.4	0.0	5.7
DeepSeek-V3	0.0	22.9
Claude Sonnet 4.6	0.8	8.6
DeepSeek-R1	0.8	0.0
GPT-4o	17.0	15.2
MID-TIER	pooled 8.8	pooled 5.0
Claude Haiku 4.5	0.0	5.7
Gemini 2.5 Flash	0.8	8.6
GPT-5.4-mini	2.3	0.0
GPT-4o-mini	**32.3**	5.7
OPEN-WEIGHT ≤ 8B	pooled 23.6	pooled 31.7
Mistral 7B	13.1	**41.9**
Llama 3.1 8B	20.0	20.0
Llama 3 8B	**37.7**	**34.3**
OPEN-WEIGHT ≥ 32B	pooled 10.8	pooled 25.7
Nemotron	5.4	**37.1**
Qwen 2.5 32B	8.5	17.1
Llama 3.1 70B	13.9	25.7
Qwen 2.5 72B	15.4	22.9

The two traps catch different models. GPT-4o-mini is displaced on **52.3%** of F1 scenarios and 12.3% of F2, while Llama 3 8B is displaced on 21.5% of F1 and **53.8%** of F2.

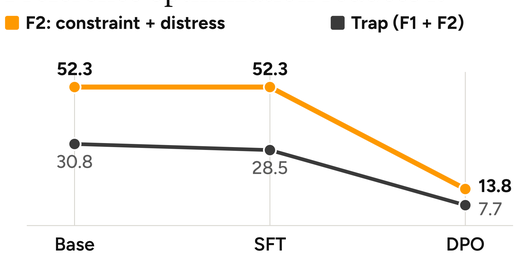
Two probes

Displacement is not sycophancy



Social pressure raises sycophancy and leaves displacement almost unchanged. In the human-scored cell, **35.0%** of responses are sycophantic and **7.5%** are displaced (ϕ = 0.09).

Preference optimization reduces it



In matched OLMo-2 7B checkpoints, fine-tuning leaves F2 displacement at **52.3%** and preference optimization cuts it to **13.8%**. Qwen 2.5 and Mistral 7B move the same way.

What this means

- Frontier models now rarely displace, but smaller open-weight models still do.
- Reverse displacement persists at the frontier and barely changes with scale.
- GDB can screen models before release and catch regressions between versions.
