

# OTTER: Effortless Label Distribution Adaptation of Zero-shot Models

Changho Shin, Jitian Zhao, Sonia Cromp, Harit Vishwakarma, Frederic Sala University of Wisconsin-Madison

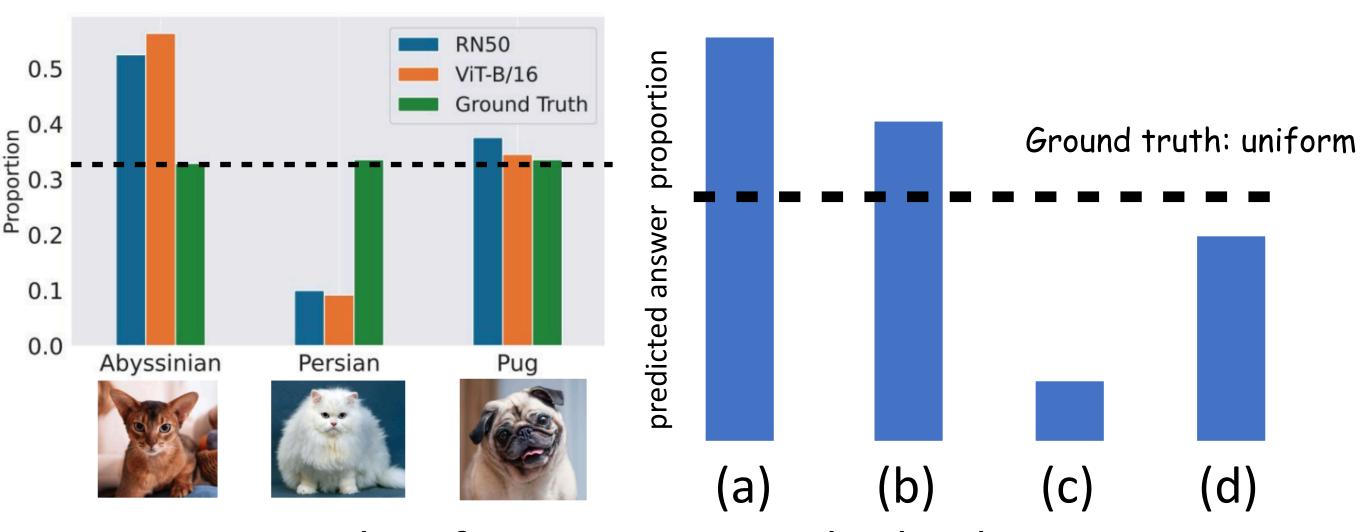

Paper Link

## **Background & Motivation**

- \* Foundation models often suffer from the biases introduced during pretraining.
- \* Label distributions are inevitably mismatched in the downstream tasks, degrading model performance.

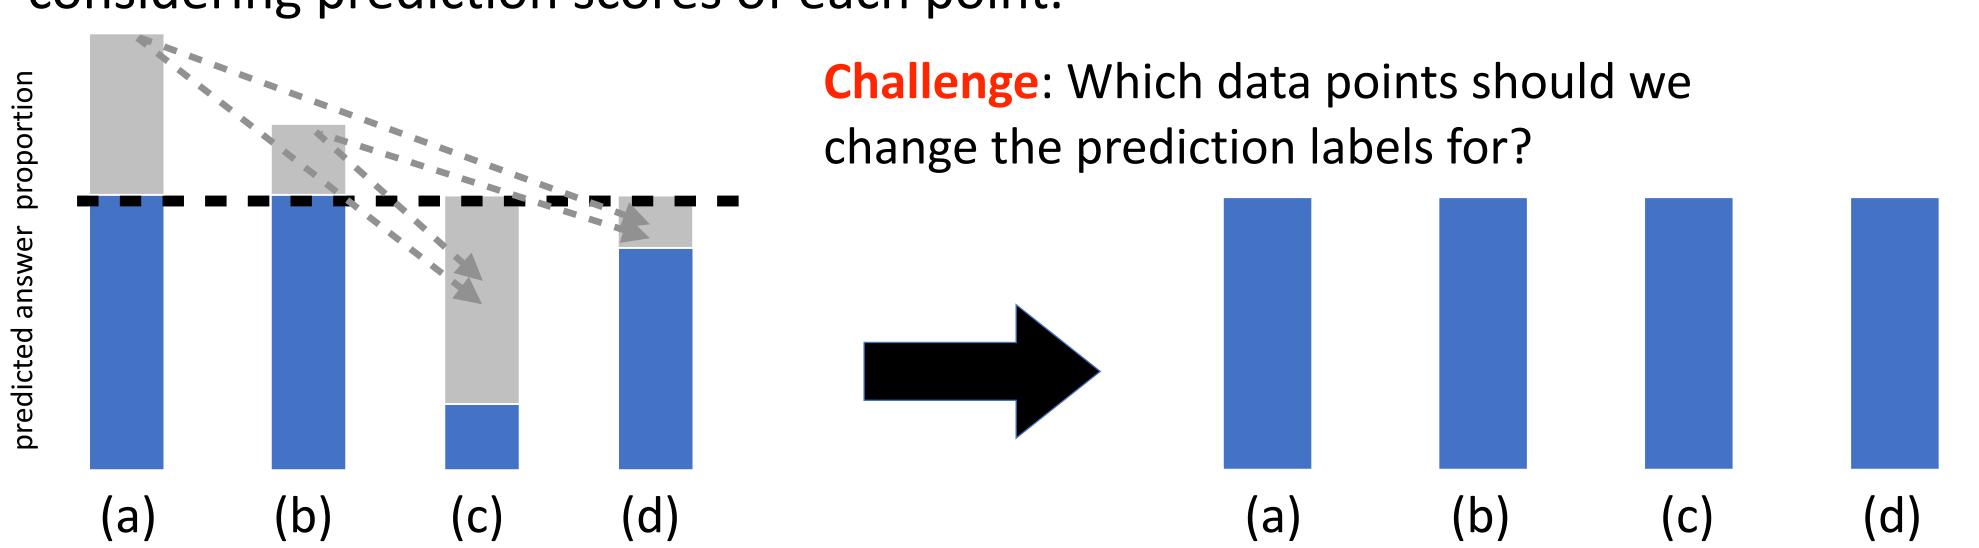

CLIP Image Classification LLM Multiple Choice Questions

- \* Can we adapt model predictions to specified label distributions instantly?
- \* We introduce OTTER, an Optimal Transport-based method to adjust model predictions according to specified label distributions.

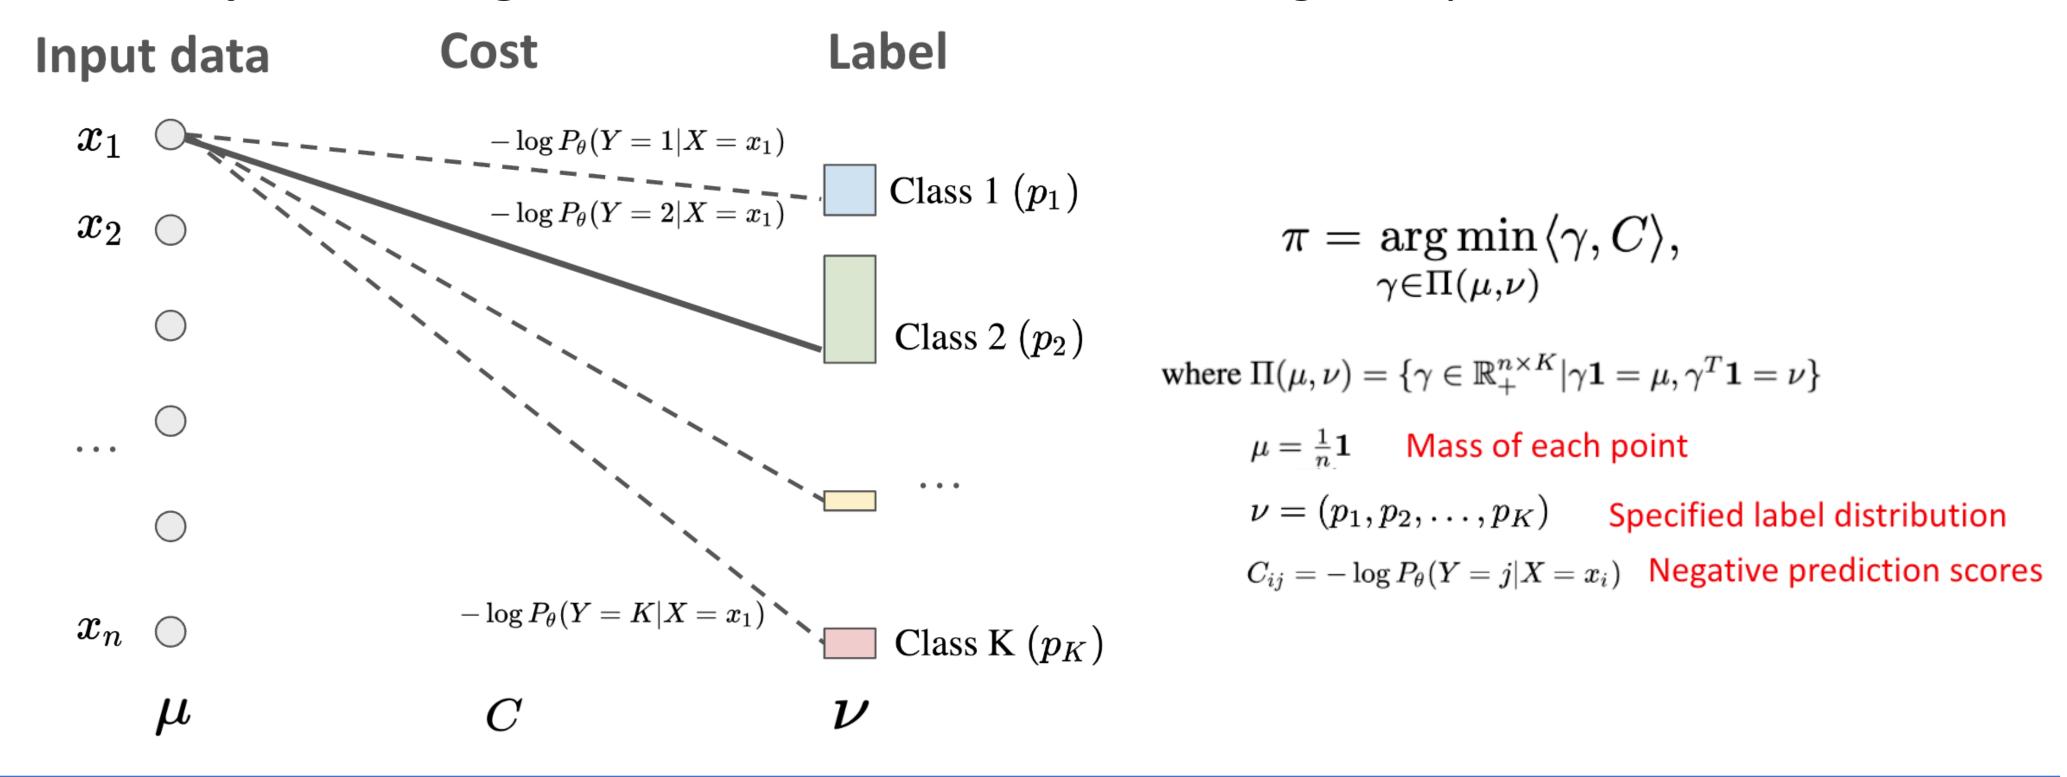

#### Idea

Redistribute model predictions to match specified label distribution, while still considering prediction scores of each point.

# Method: Optimal Transport for Classification

Solve Optimal Assignment Problem with costs as negative prediction scores.

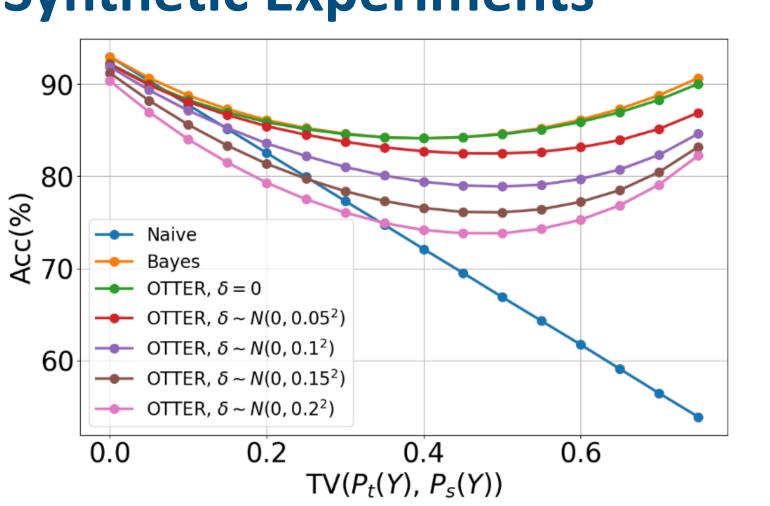

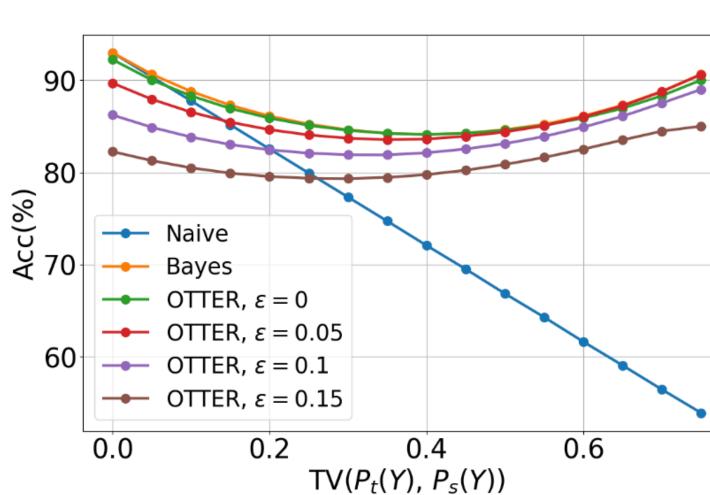

## **Theoretical Results**

- **✓** OTTER ensures **consistency** with zero-shot predictions.
- ✓ Under label shift, OTTER with true label distribution works as a **Bayes-optimal classifier**. ✓ Its additional error beyond Bayes error decomposes into the errors in the specified label distribution and calibration.

# Experiments

dence score.

(a) Prediction accuracy changes with perturbed confi- (b) Prediction accuracy changes with perturbed label

- \* OTTER achieves the Bayes error rate in noise-free scenarios.
- error arises from the noise in label distribution specification and calibration.
