

# MLE-STAR: Machine Learning Engineering Agent via Search and Targeted Refinement

Jaehyun Nam, Jinsung Yoon, Jiefeng Chen, Jinwoo Shin, Sercan O. Arik, Tomas Pfister

*NeurIPS 2025*

# What are Machine Learning Engineering Agents?

**Goal:** Determining the optimal solution for a given ML problem.

- **Input:** task descriptions, datasets.
- **Output:** solution script.
  - Typically, a full python code.
  - Trained models, test metrics, etc.

# What are Machine Learning Engineering Agents?

**Goal: Determining the optimal solution for a given ML problem.**

- **Diverse tasks:** Classification, Regression, Image denoising, ...
- **Diverse modalities:** Tabular, Image, Text, Audio, ...
- **MLE-STAR is evaluated on:**
  - 2 Tabular Classification, 2 Tabular Regression.
  - 9 Image Classification, 1 Image Denoising.
  - 4 Text Classification, 2 Sequence-to-Sequence.
  - 2 Audio Classification.

# Motivations.

How can we incorporate **state-of-the-art approaches**, ensuring **scalability**?

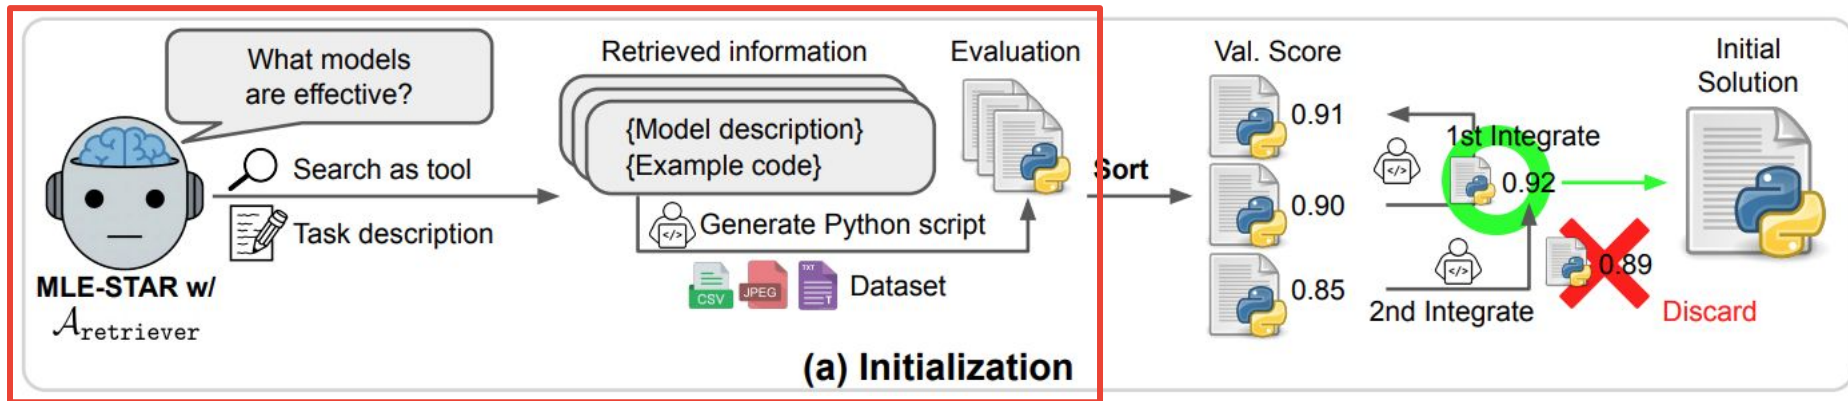

- MLE-STAR utilizes Google Search to retrieve such approaches.

How can we explore different options on **specific pipeline** extensively?

- E.g., how can we experiment **different feature engineering options**?
- MLE-STAR **extracts a specific code block**, and then concentrates on exploring strategies that are targeted to that component.

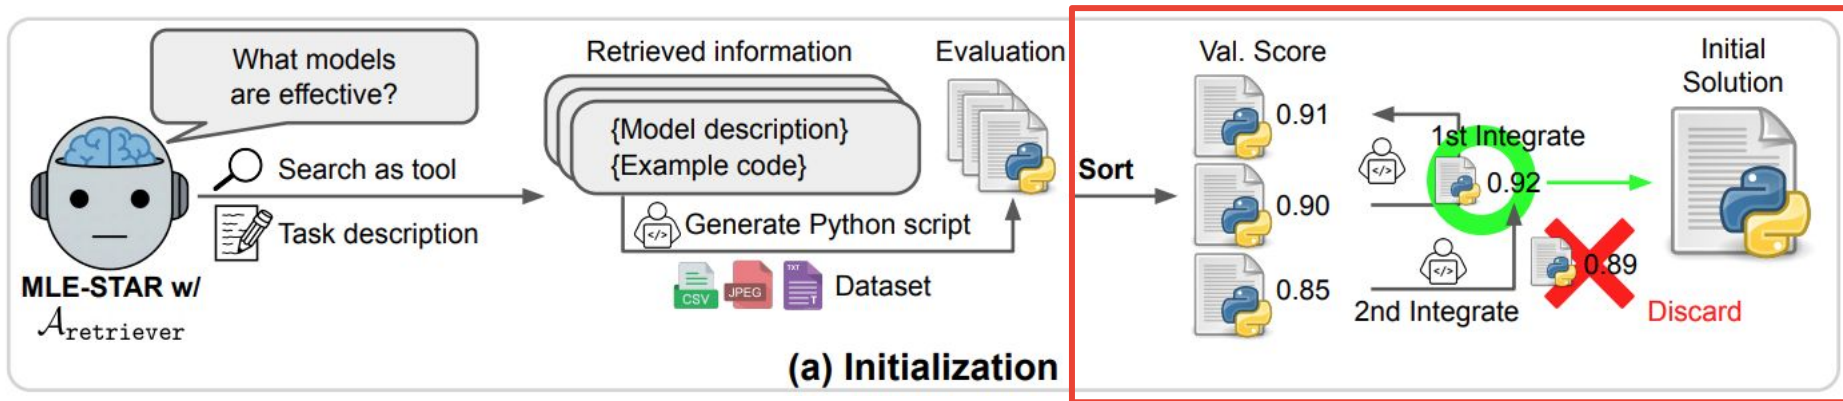

# Initialization using web search as a tool.

- Search candidate models.
  - Depending on **task description**, which contains task type, modalities, ...
  - Retrieved models are then evaluated on the validation metrics.

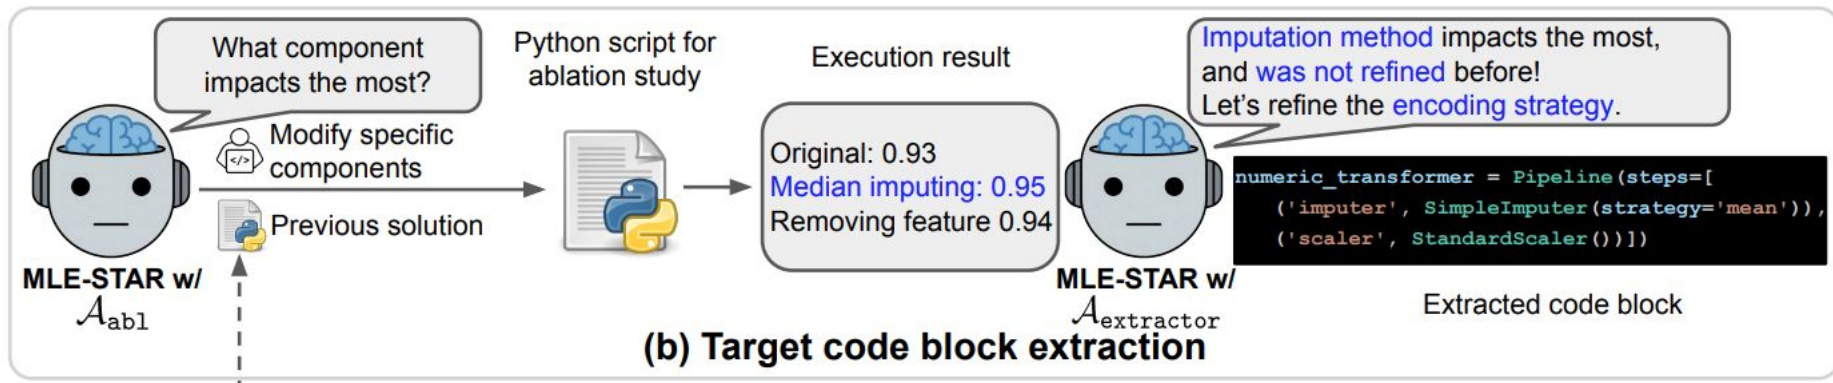

# Initialization using web search as a tool.

- Search candidate models.
- Merge retrieved models based on the validation metrics.
  - We first sort in descending order.
  - We **sequentially incorporate** the candidate models until the **validation score no longer improves**.

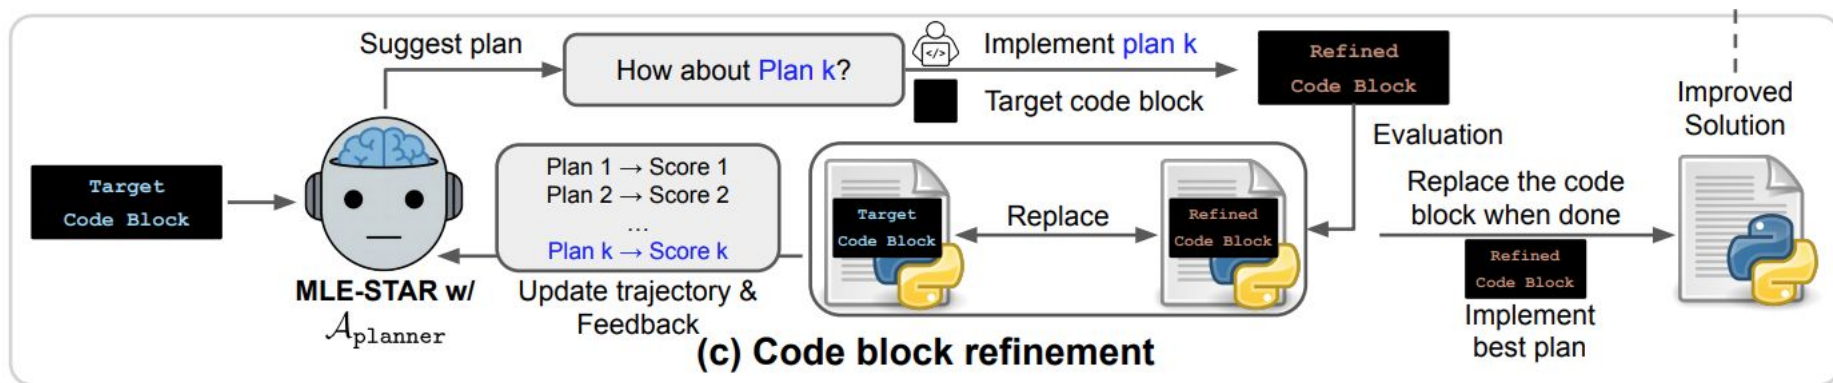

# Refining a code block for solution improvement.

- MLE-STAR identifies **specific code blocks** to explore **specialized strategies**.
- **But how** can we identify the code block that have the **greatest impact**?
  - MLE-STAR performs an ablation study.
  - MLE-STAR generate a code for ablation study, which creates variations of the current solution by modifying or disabling specific components.

# Refining a code block for solution improvement.

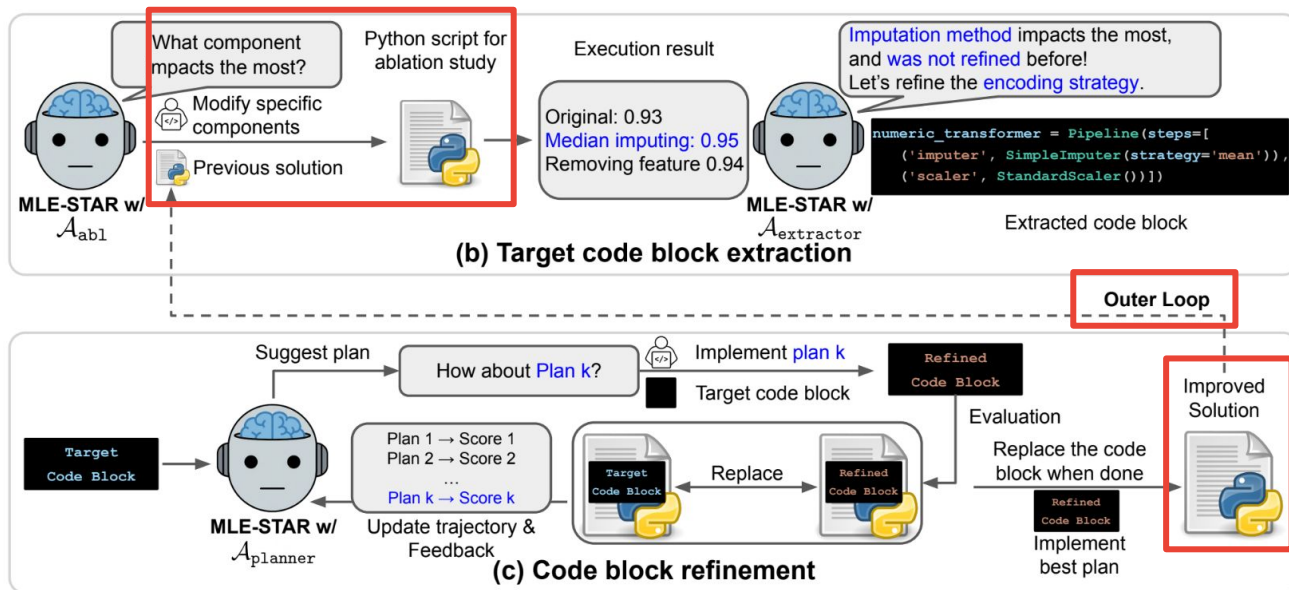

- MLE-STAR **iteratively** explores **refinement strategies** on the target code block.
  - Focus on the selected code block and refine it with **diverse ways**.
  - Here, the previous experiment results are used as a feedback.

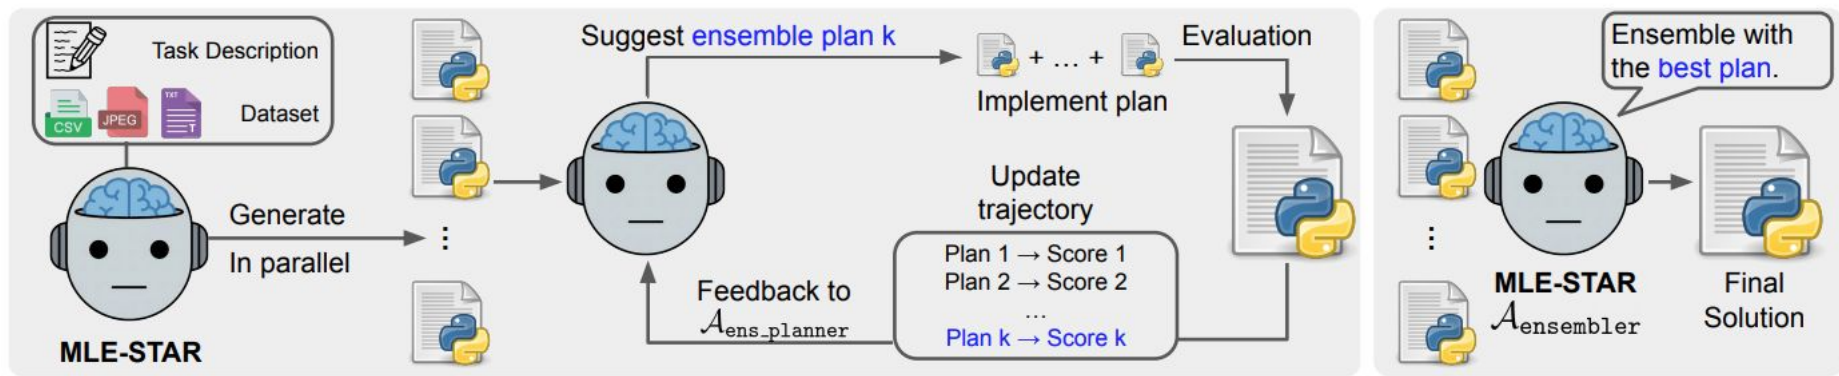

# Refining a code block for solution improvement.

- Target code block is also selected repeatedly.
  - After the code block refinement, MLE-STAR performs the ablation study on the improved solution.

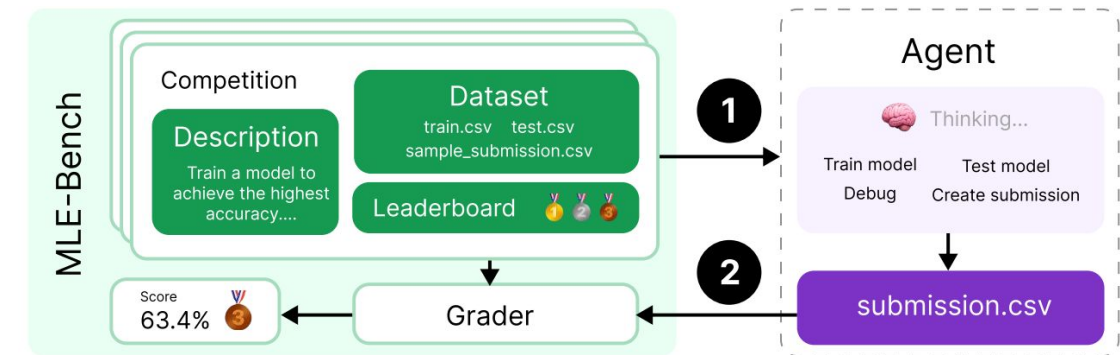

## Further improvement by exploring ensemble strategies.

- Alike [model ensembling](#), suboptimal solutions might contain complementary strengths, and combining multiple solutions could lead to superior performance.
- MLE-STAR automatically discovers effective strategies for ensembling.
  - Using [parallelly generated training codes](#), we ensemble those solutions.

# Main experiment: MLE-Bench.

- A benchmark of 75 offline Kaggle competitions.
  - We use 22 low complexity competitions.
- Evaluation metric: Medals (like Kaggle competition).

	0-99 Teams	100-249 Teams	250-999 Teams	1000+ Teams
<b>Bronze</b>	Top 40%	Top 40%	Top 100	Top 10%
<b>Silver</b>	Top 20%	Top 20%	Top 50	Top 5%
<b>Gold</b>	Top 10%	Top 10	Top 10 + 0.2%*	Top 10 + 0.2%*

# Main experiment: MLE-Bench.

- MLE-STAR achieves significant performance gain over the SOTA baseline.
  - 60+% any medals / 80+% above median submissions.

## Effectiveness of proposed ensemble methods.

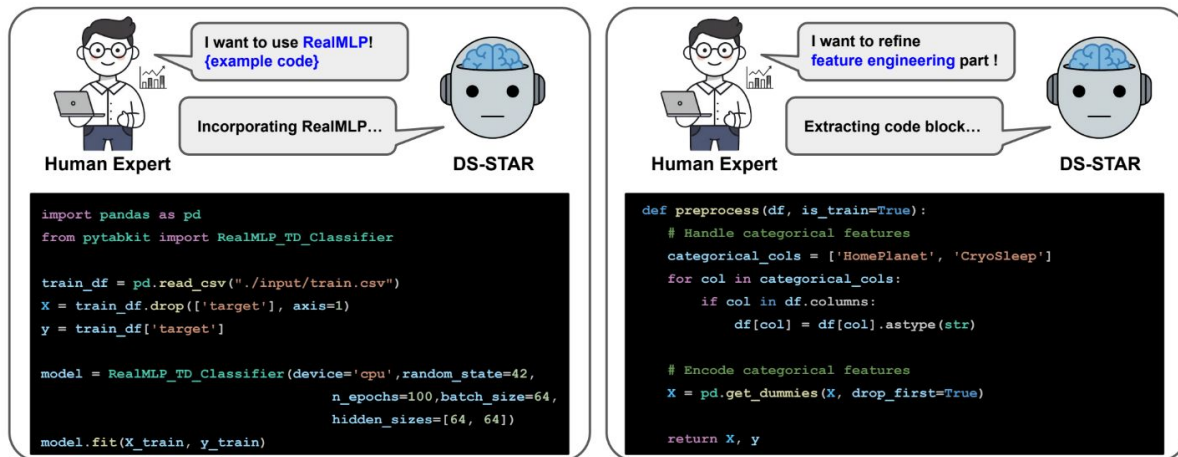

- MLE-STAR shows a performance improvement even without additional ensemble.
- Simple strategies, such as selecting the solution with the best validation score or averaging final submissions, also offer benefits.
  - However, [our proposed method shows stronger effectiveness.](#)

Ensemble strategy	Made Submission (%)	Valid Submission (%)	Above Median (%)	Bronze (%)	Silver (%)	Gold (%)	Any Medal (%)

# Human intervention.

MLE-STAR adopts even more recent model with **minimal human intervention**.

- E.g., by manually adding a model description for RealMLP, MLE-STAR successfully integrates its training into the framework.
- E.g., users can also specify the target code blocks by replacing the ablation summary with manually written instructions.

## Key takeaways.

**MLE-STAR is an effective and robust ML Engineering Agent that:**

- Uses web search as a tool to retrieve task-relevant effective approaches.
- Performs ablation study to extract the impactful code block.
- Refines a target code block by exploring component-specific strategies.
