Gligorijevic, R. Bonneau, Saeed Saremi**

NeurIPS 2025

Genentech
A Member of the Roche Group

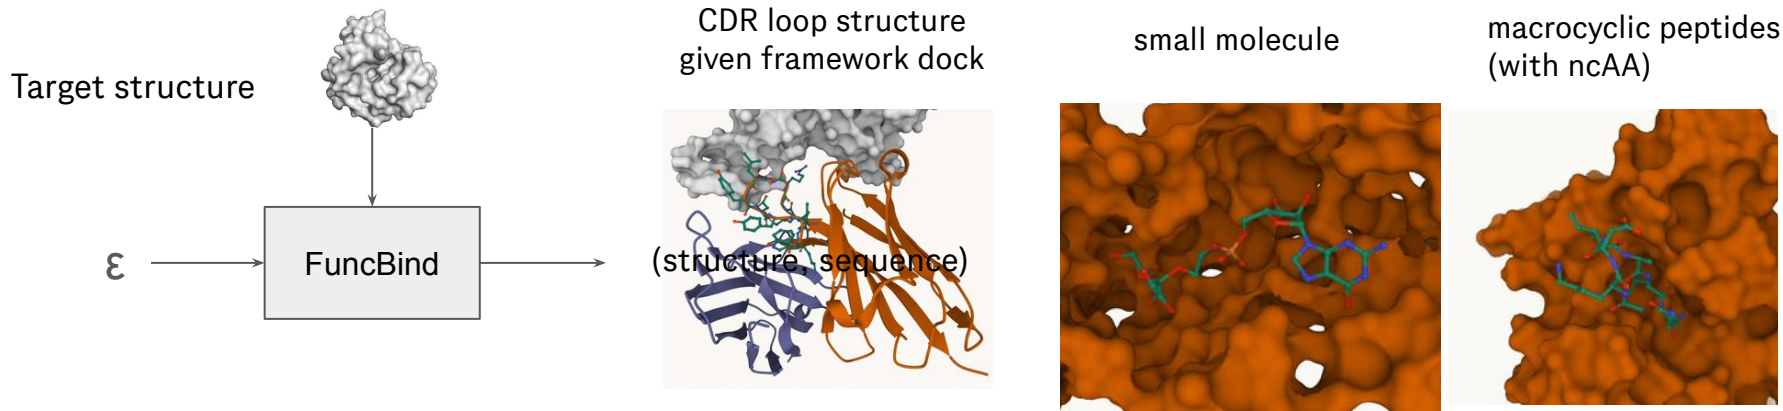

Context: structure-conditioned de novo generation

Many existing models *usually*

- inspired by AF style architectures
- limited to sequences of canonical AAs and pre-defined sequence lengths

An unified structure conditioned generative model

- Single unified model trained across data modalities (small molecule, antibody CDR loop, cyclic peptide)
- All-atom modelling
- Variable sequence lengths
- Handles constraints such as non-canonical amino acids, cyclized peptides etc.

A vision-based model for molecule generation

- Vision-based approach that represents molecules as 3D densities.
 - Auto-encoder of input molecules based on neural fields [Kirchmeyer et al., NeurIPS 2024](#)
 - UNet-based conditional denoiser scaled up to 5B parameters [Karras et al., CVPR 2024](#)

- Postprocessing to recover point cloud from generated 3D density

Sampling with score based approaches

Diffusion
Ho et al., 2020

Walk Jump Sampling
Saremi et al., 2019

Conclusion

- Check the paper for the following
 - In-silico benchmarking against standard baselines for small molecule, antibody CDR loop and macrocyclic peptide generation.
 - Wetlab validation for CDR H3 redesign for 2 anonymized targets.
- Code and weights (Apache 2.0) to be released
 - <https://github.com/prescient-design/funcbind>
- Dataset of macro-cyclic peptide - protein complexes to be released
